

How to connect personal devices to CISD wireless network.

- **You do not need a wireless password.**
- Your device should discover 2 wireless networks, you will need to attach to the Cville_Public network.
- A screen should pop up giving you the opportunity to register your device. If it doesn't, the first time you try to access the internet and go to a site like Google you should be asked to register your device.
- There are 3 screens in the registration process.
 - One will ask for your user name and password. You need to use what you use at school to log on a computer, like vparker or a students' would be like 14vparker, and then put in your school password.
 - Next a screen should come up that has your first name and last name, if those two fields are blank, key them in. On this screen you will also have to put in a check that you agree... Then click the login button.
 - It will go to a 3rd screen that says it is processing for a while (this screen should display no longer that 3 minutes). After the processing is complete you should get a screen saying it was successful, and then after another short wait it should go to our home page.
 - At that point everything is complete and you can start navigating the internet. You should never have to register that device again, when you bring it back to school it should just attach and work.
- Each teacher can register 2 devices. If you own more than that and would like to register them, please contact me and I can increase your limit to 3 or 4.
